

claims: I claim:

1. A wireless access system arranged for providing a plurality of wireless methods for a wireless station operable in said wireless access system for accessing a plurality of services, the system comprising:
 2. a access network switching unit,
 3. means for switching said wireless methods.
4. The wireless access system of claim 1 wherein said wireless access system includes a plurality of networks, and
 5. said networks employ said wireless methods as the medium for access to said network.
6. The wireless access system of claim 1 wherein said switching means is controlled by said access network switching unit, and
 7. said access network switching unit consists of a process for operating a general purpose computing device to enable said computing device to execute commands in a program based on a combination of data, and
 8. said wireless method is switched based on a result produced by said program.
